Manage Security Concerns with

AxcessIT

SafeStone's AxcessIT provides locked-down, granular security control for mixed computing environments while delivering simple, easy-to-use functionality for deployment, administration and maintenance. Your security personnel can perform all functions from any browser-enabled platform in the enterprise. AxcessIT modularity allows you to grow into new functionality easily and painlessly.

Everyone using secured data and applications becomes much more productive. Security is less cumbersome to administer, and users quickly login without juggling multiple passwords and burdening the help desk to figure out which one they forgot or misplaced. Meanwhile, corporate information assets are protected from theft, deliberate abuse and inadvertent access and error.

SafeStone's AxcessIT Advantages

- **Centralized security policies** are enforced across the entire organization.
- **Roles** are quickly and easily assigned to users.
- **Browser access** enables administration of security using a Java-enabled browser from any platform within the enterprise.
- **Work Flow** control removes unwanted paper trails, authenticating requested actions and maintaining online audit of all documentation.
- **Web Access Management** controls who can come into your organization via your Internet portal to gain access to your legacy based systems.
- **LDAP** directory services ensure fast retrieval and integration of basic user information.
- **Multi-platform access control** through encrypted communications.
- **Password synchronization** eliminates multiple passwords for individual users in a heterogeneous environment.
- **Real-time security information** for each platform. Security decisions are implemented in real time, so that administrators are confident that they are dealing with current security information.
- **Modular security components** let you expand to your specific needs.
- **Scaleable Architecture** facilitates implementation and growth.

POWERFUL FEATURES OF AxcessIT

Policy Management

Provides an easy interface to manage how security settings are enabled and implemented. You control simple parameters, such as password lengths, as well as cryptographic algorithms and key lengths. All settings are controlled through a browser interface and policies can be created and embedded in your enterprise with a simple point and click.

Role Management

Role Management enables administrators to quickly create, modify and delete any role facilitating fast integration of employees, business partners and customers. Distinct roles are mapped to existing job functions and their access authority so that new employees can be brought on quickly and departing or changing employees are modified accordingly.

User Management

Making full use of the Roles that have been defined within SafeStone's AxcessIT you can provision user access rights to your systems and applications. Moving personnel from one job function to another is performed effortlessly by a simple drag and drop operation. Powerful templates enable users to have accounts defined for each system and application, which are then combined together within AxcessIT for granular control. New users can be jump-started into action with immediate results. Removing access is available at the click of a button and full audit trails are kept for reporting and analysis.

Increase Security, Productivity and Efficiency

SafeStone's AxcessIT Resource Manager frees up valuable IT resources, makes life easier for users across the enterprise and helps to lock down security for all your networked platforms. You can significantly reduce costs in terms of risks of security breaches, increased productivity and automating tasks.

LDAP Utilization

To leverage the utilization of existing user information, SafeStone's AxcessIT Resource Manager provides facilities to import and export data. Existing directory services can be utilized to store this data and, via AxcessIT Resource Manager, make this data available to other applications. Where necessary, sensitive information is encrypted to ensure integrity and confidentiality.

Password Management

AxcessIT allows you to, on a selectable and granular basis, synchronize all passwords associated with a user across the whole heterogeneous enterprise - they can use the same password throughout the system. The process is elegantly implemented utilizing LDAP user information and the Role Manager database. No passwords ever travel in clear text over your networks. The ability to reset and control passwords at local levels, coupled with a powerful self-service mechanism, reduces password related calls to your help-desk by up to 95% and provides increased productivity, reduced costs and ROI benefits.

Central And Delegated Management

AxcessIT recognizes the desirability to control security from a central point. By organizing the administrative structure within AxcessIT, central control is maintained throughout the system via the Policy Management and selected security management tasks can be delegated to local administrators empowering them with the ability to manage users at a local level. These delegated tasks include resource provisioning via the Role and Password Management aspects of the product.

Work Flow Management

AxcessIT Work Flow Management option removes the need to ever fill out another paper-based form. Requests can be performed online, delivered to the relevant people, and authenticated online with real-time user identification. The complete end-to-end process can now be totally automated, increasing turn-round time, productivity and security.

Audit Management

Every transaction processed within AxcessIT Resource Manager is logged in the Audit Manager database where each audit record is digitally signed for authenticity. Authorized users can view or print reports through a browser at any point in the enterprise.
