

**5 STAR AWARD
FOR DetectIT FROM
SECURE COMPUTING**

DetectIT has achieved the maximum 5 Star Award by Secure Computing Magazine "All in all, this is a very comprehensive system of which we have only just scraped the surface. If you are using AS/400's, while you may already have some security either from OS/400 or from other security applications, none that we have so far seen, deliver security and management as comprehensive as DetectIT."

**DETECTIT QUALITY
GUARANTEE**

SafeStone's product quality and all the company procedures are audited by BVQI external auditors twice a year to ensure conformance. DetectIT has been registered with BS EN ISO9001 and TickIT for quality since 1993. TickIT is awarded to companies who follow a quality software development process.

SafeStone's software is also protected by an Escrow arrangement, currently lodged with the NCC under agreement 5609.

SafeStone Technologies PLC is a global leader in security systems management providing organizations with secure access controls across the extended enterprise, enabling effective management and compliance of the corporate IT and e-business infrastructure.

SafeStone solutions are enterprise-wide providing policy compliance, auditing facilities, vulnerability assessment, intrusion detection, user access management and web access control.

Developed from over 15 years of specialized experience in the IT security marketplace, SafeStone's solution suite is comprised of the award-winning DetectIT for the iSeries 400 and AxxessIT which delivers secure access and Web-based control for the enterprise.

Manage Your IT Security Policy for the iSeries with

DetectIT®

SafeStone's DetectIT eliminates security exposures while greatly enhancing security management and access efficiency for the IBM iSeries 400 (AS/400). Administrators gain precise control over systems and interdependent security environments. Automated, easy-to-use interfaces provide simple, centralized control of iSeries 400 networks, profiles and users. You spend less time struggling with complex procedures and more time delivering secure data and applications to your enterprise.

DetectIT automates time-consuming tasks, centralizes iSeries 400 security control across networks of iSeries 400's, manages how other platforms access the iSeries, and provides granular security for objects, applications and databases.

Powerful Benefits

DetectIT provides total confidence that systems are properly protected.

- Easy implementation of security policies
- Quick and intuitive graphical user interfaces (GUI's) allow easy administration
- Seamless integration of the best technology available to provide enterprise-wide security for multiple operating systems, applications and databases
- Central control of access and security with remote delegation capabilities via Local Security Administrators
- Modular, cost-effective system
- OS upgrades do not affect the DetectIT deployment

Access Control Security systems often lack the flexibility to mirror the way you work, making it difficult to reflect the security requirements of different departments and workgroups. By design, DetectIT Access Control provides enhanced flexibility, customization and centralized control.

- Subdivide iSeries 400's to flexibly manage separate security environments
 - Enroll users on multiple iSeries 400's with single sign-on capability
 - Synchronize passwords and profiles
 - Customize time-out, active sessions, password control and profile control for each security environment
 - Delegate tasks to "local security administrators" without compromising central control of security
 - Comprehensive interrogation
 - Automated activation, suspension and deletion of profiles
 - Increase access security levels with RSA SecurID*
 - Easily manage profiles
 - Simplify administration
- * DetectIT and RSA Security provide the only two-factor user identification and authentication solution for the iSeries 400.

Examiner Policy Compliance Control Every organization needs to define security policy and then monitor and manage compliance with that policy. DetectIT Examiner automatically checks compliance of iSeries 400 settings against a pre-defined policy.

- Create new policies without programming or SQL skills
- Templates included for standard or recommended policies
- Add new policy groups as new functions to the iSeries 400 are added
- Flexible reporting for corporate-wide, group or item compliance

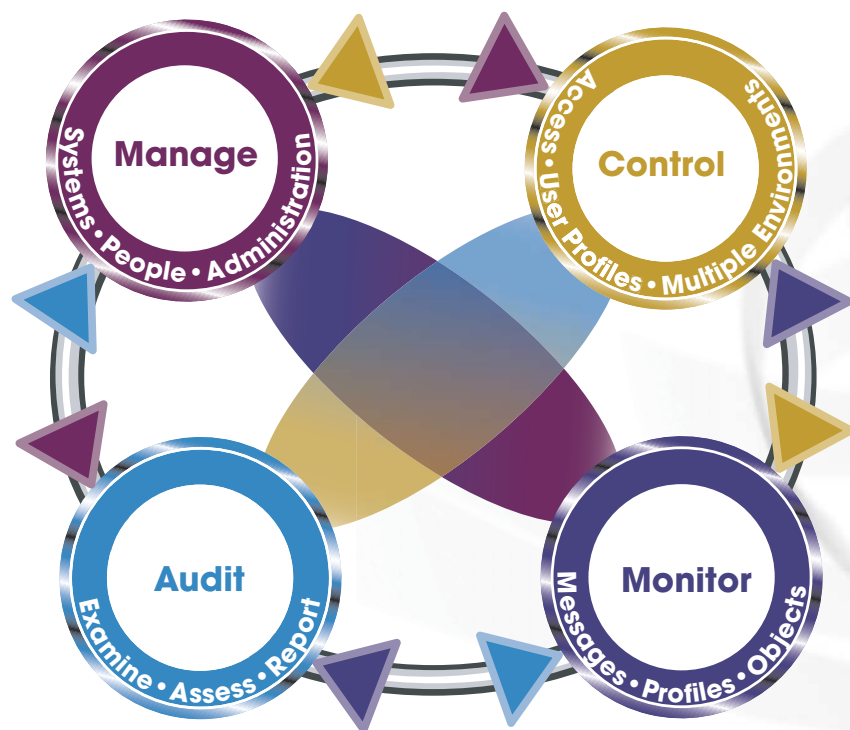

Client/Server Control DetectIT Client/Server controls how requests received from client machines are processed on your iSeries 400. It monitors all the exit points for requests generated by different types of servers by creating a separate Client/Server security environment and overcoming any conflicts with the authority processing in the iSeries 400 legacy system.

- Control how clients access critical data on the iSeries 400
- Control all server tasks, ODBC, DDM and DRDA file accesses and data queue applications
- Control TCP/IP access, FTP file transfers, remote commands and REXEC
- Activate a file monitor on the iSeries 400 to keep a close watch on sensitive files

Audit & Monitor Control DetectIT Audit and Monitor helps simplify the process of extracting and examining activity data on the iSeries 400.

- Total monitoring of all system activities, security violations, breaches and unauthorized events
- Monitor all security messages
- Monitor specific profiles
- Monitor files and objects for changes
- Automated alerts
- Interrogate files for any field-level changes
- Filtered, summary and detailed audit reports
- Event-driven reporting enterprise-wide
- Print audit reports
- User-friendly GUI

Advanced Integration for Multi-Platforms DetectIT interfaces with a number of complementary enterprise security systems including Symantec's Enterprise Security Manager (ESM) and Intruder Alert, RSA's SecurID®, and J.D. Edwards through QSoftware's Aquila. With these systems, DetectIT can secure the entire enterprise, from the iSeries 400 to the desktop.

In order to meet the needs of complex and changing security environments, DetectIT is modular by design. Each module provides distinct security control, and they integrate into a seamless, complementary, impassable layer.
